Design Patterns

The Observer Pattern

د. رياض سنبل

Sample Problem

3 the display that shows users the current weather conditions.

First Solution!

```
public void measurementsChanged() {
```

```
    float temp = getTemperature();
    float humidity = getHumidity();
    float pressure = getPressure();
```

```
    currentConditionsDisplay.update(temp, humidity, pressure);
    statisticsDisplay.update(temp, humidity, pressure);
    forecastDisplay.update(temp, humidity, pressure);
```

```
}
```

Grab the most recent measurements by calling the `WeatherData`'s getter methods (already implemented).

Now update the displays...

Display One

Display Two

Display Three

First Solution!

Display One

Display Two

Display Three

For every new display element we need to alter code. We have no way to add (or remove) display elements at run time.

```
measurementsChanged() {  
    temp = getTemperature();  
    humidity = getHumidity();  
    pressure = getPressure();  
}
```

Grab the most recent measurements by calling the `WeatherData`'s getter methods (already implemented).

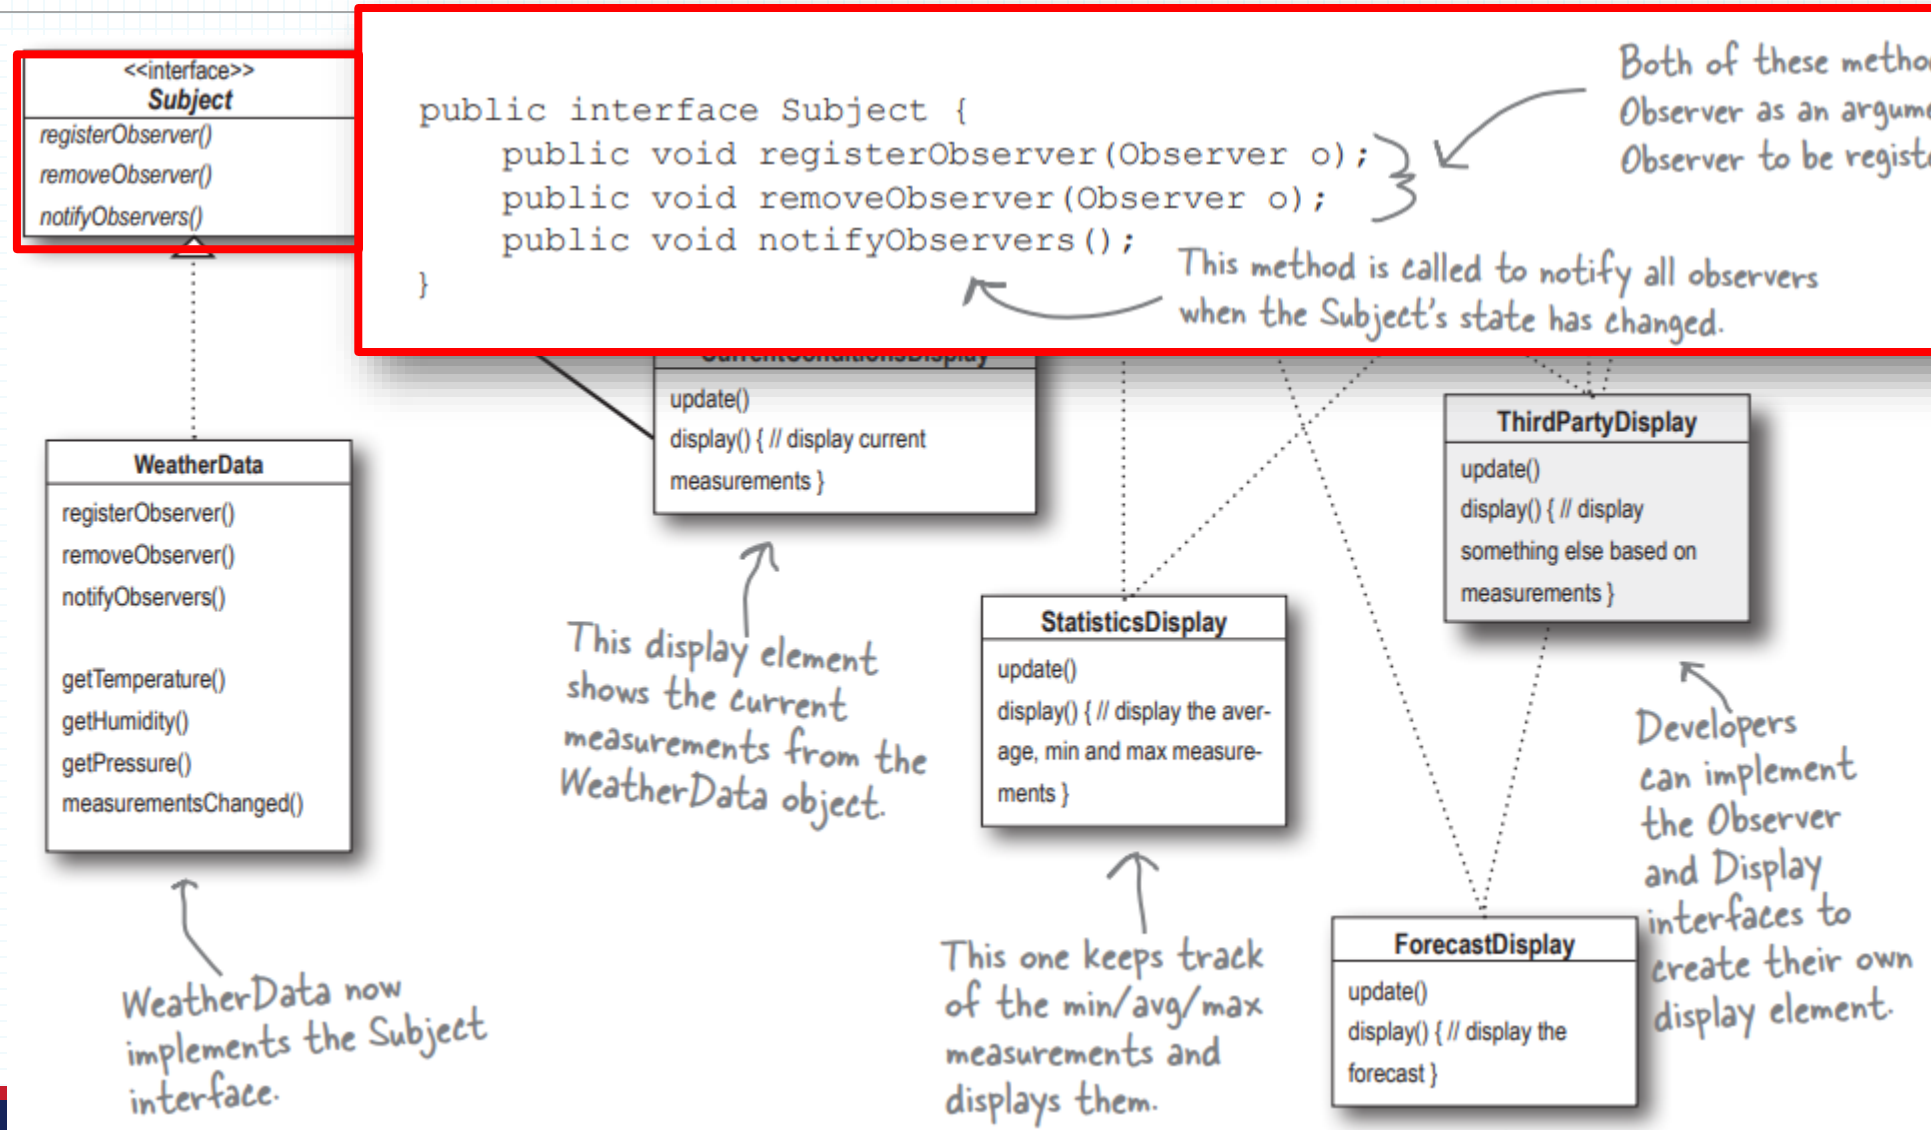

```
currentConditionsDisplay.update(temp, humidity, pressure);  
statisticsDisplay.update(temp, humidity, pressure);  
forecastDisplay.update(temp, humidity, pressure);  
}
```

Now update the displays...

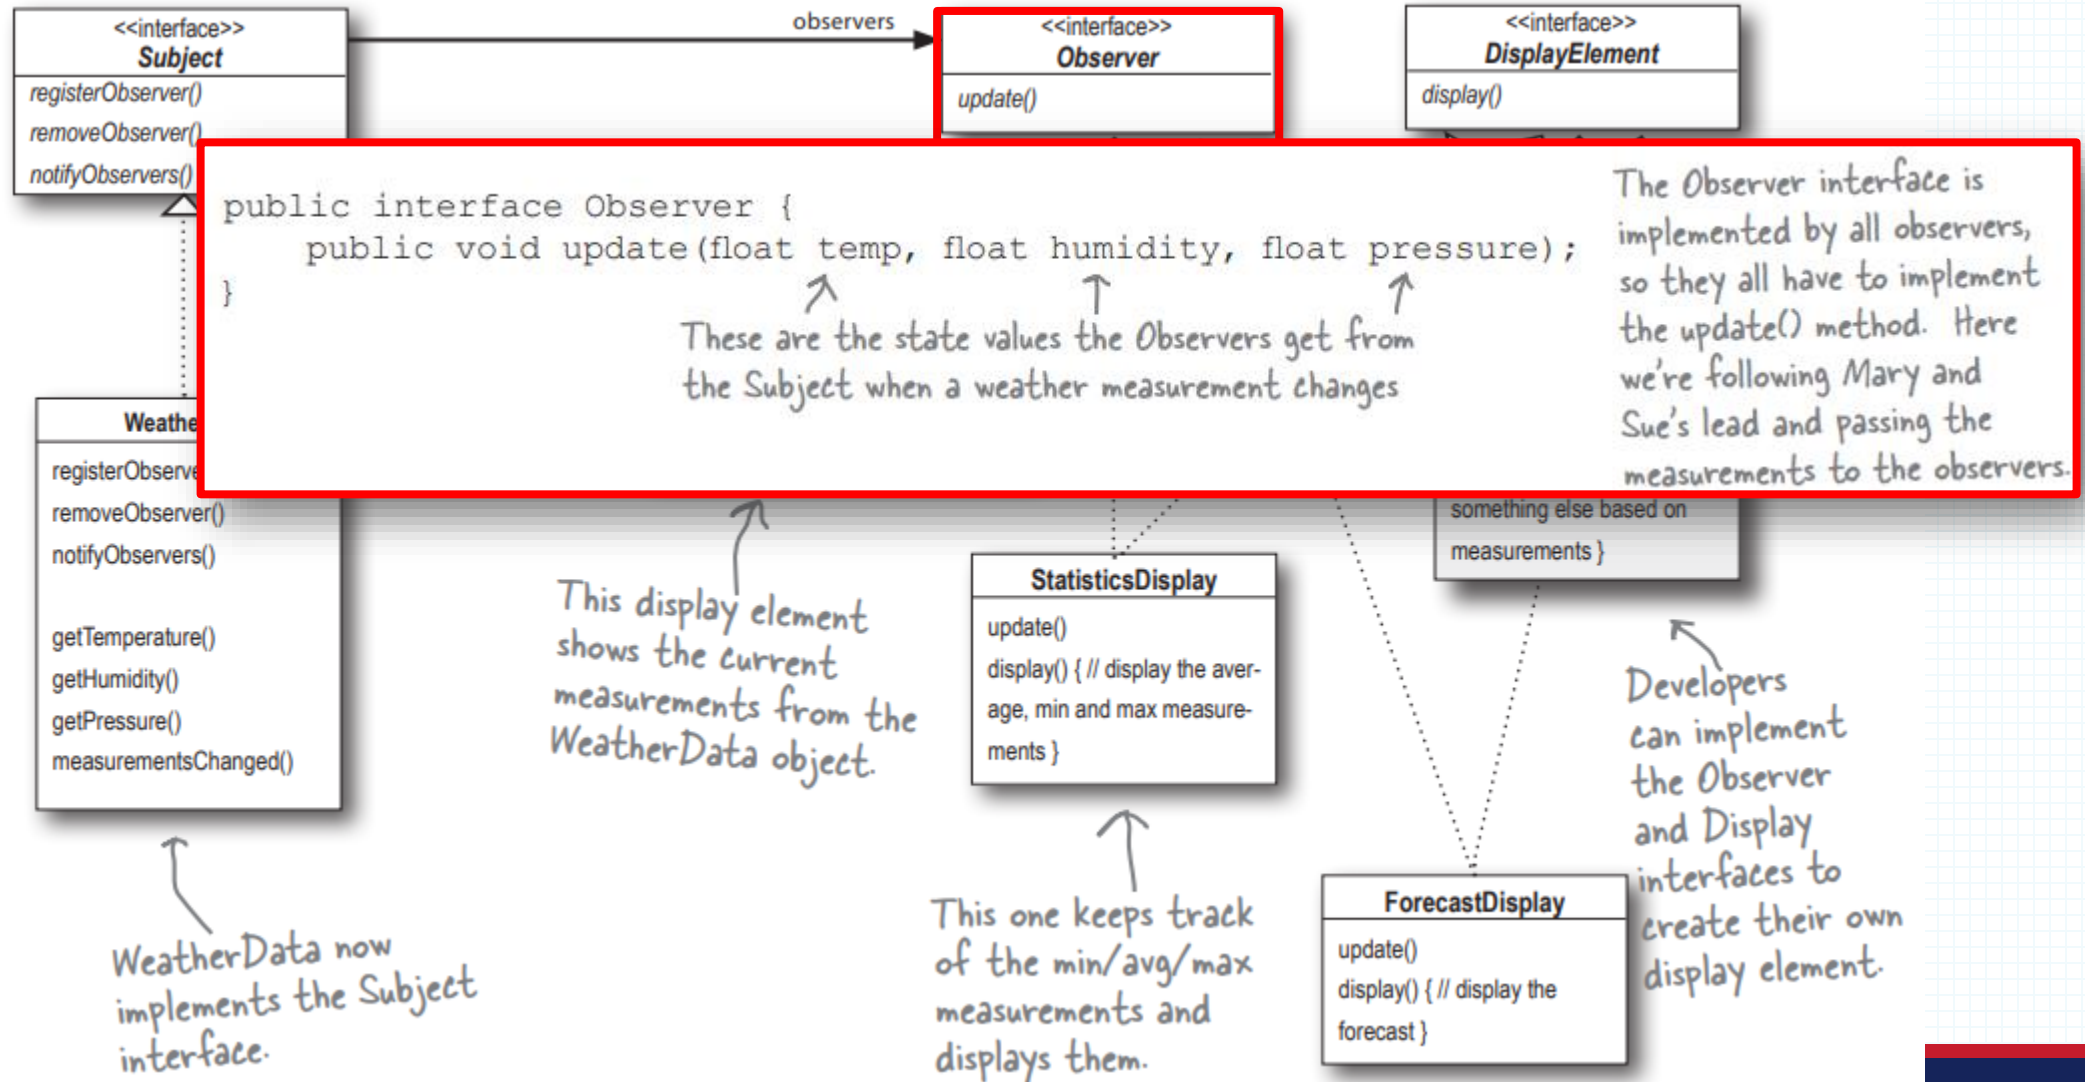

Better Solution

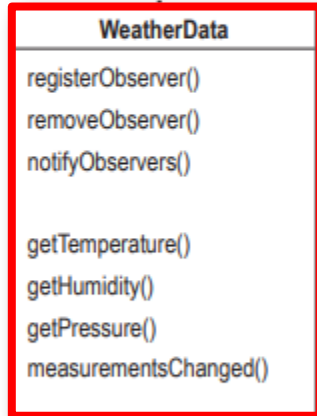

Better Solution

Better Solution

Better Solution

WeatherData now implements the Subject interface.

Here we implement the Subject Interface.

```
public class WeatherData implements Subject {
    private ArrayList observers;
    private float temperature;
    private float humidity;
    private float pressure;

    public WeatherData() {
        observers = new ArrayList();
    }

    public void registerObserver(Observer o) {
        observers.add(o);
    }

    public void removeObserver(Observer o) {
        int i = observers.indexOf(o);
        if (i >= 0) {
            observers.remove(i);
        }
    }

    public void notifyObservers() {
        for (int i = 0; i < observers.size(); i++) {
            Observer observer = (Observer)observers.get(i);
            observer.update(temperature, humidity, pressure);
        }
    }

    public void measurementsChanged() {
        notifyObservers();
    }

    public void setMeasurements(float temperature, float humidity, float pressure) {
        this.temperature = temperature;
        this.humidity = humidity;
        this.pressure = pressure;
        measurementsChanged();
    }

    // other WeatherData methods here
}
```

WeatherData now implements the Subject interface.

We've added an ArrayList to hold the Observers, and we create it in the constructor.

When an observer registers, we just add it to the end of the list.

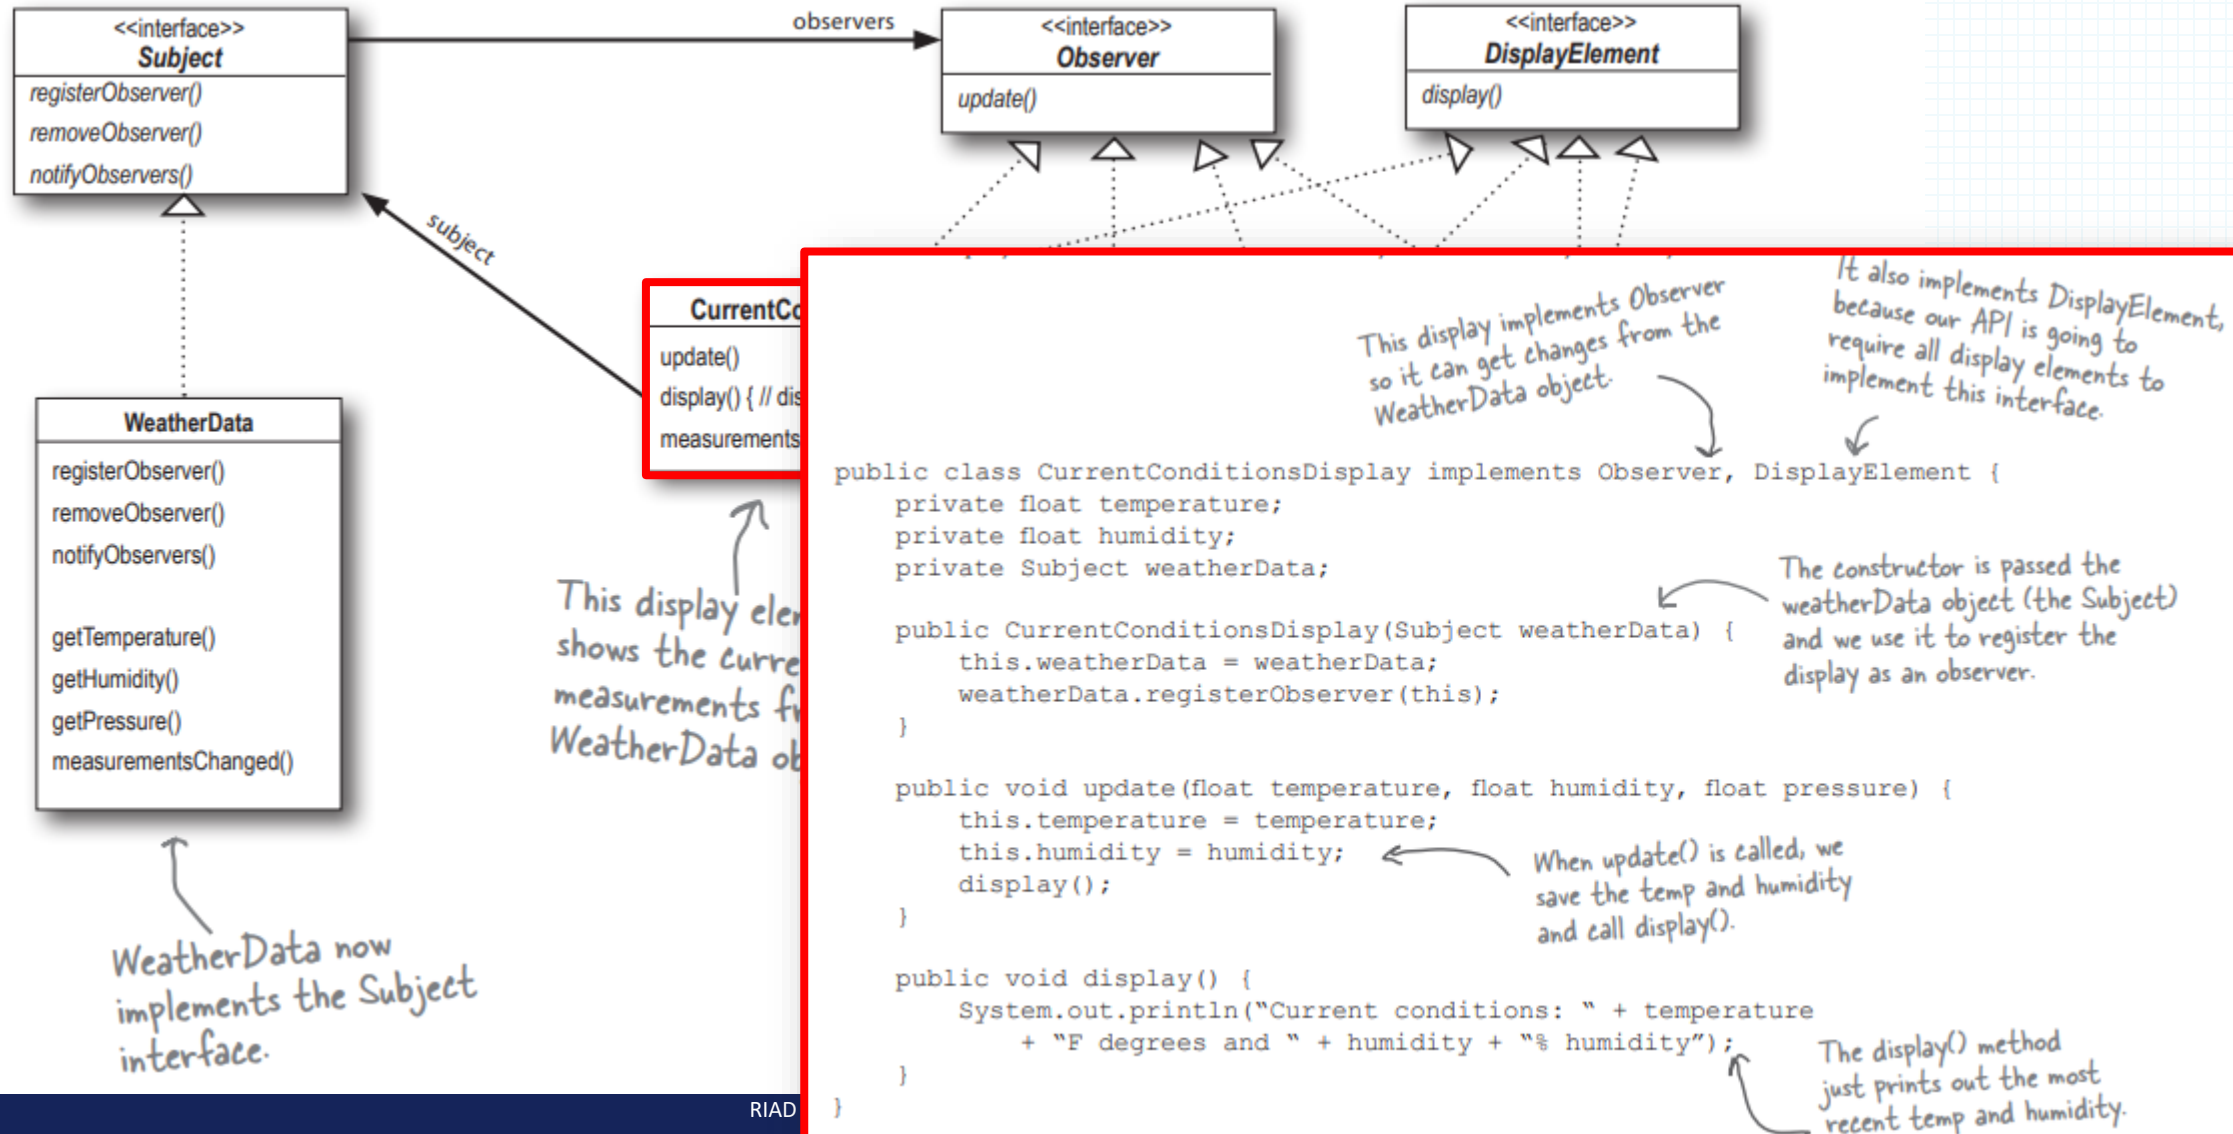

Likewise, when an observer wants to un-register, we just take it off the list.

Here's the fun part; this is where we tell all the observers about the state. Because they are all Observers, we know they all implement update(), so we know how to notify them.

We notify the Observers when we get updated measurements from the Weather Station.

Okay, while we wanted to ship a nice little weather station with each book, the publisher wouldn't go for it. So, rather than reading actual weather data off a device, we're going to use this method to test our display elements. Or, for fun, you could write code to grab measurements off the web.

Better Solution

Sample usage

```
public class WeatherStation {  
    public static void main(String[] args) {  
        WeatherData weatherData = new WeatherData();  
        CurrentConditionsDisplay currentDisplay =  
            new CurrentConditionsDisplay(weatherData);  
        StatisticsDisplay statisticsDisplay = new StatisticsDisplay(weatherData);  
        ForecastDisplay forecastDisplay = new ForecastDisplay(weatherData);  
  
        weatherData.setMeasurements(80, 65, 30.4f);  
        weatherData.setMeasurements(82, 70, 29.2f);  
        weatherData.setMeasurements(78, 90, 29.2f);  
    }  
}
```

If you don't want to download the code, you can comment out these two lines and run it.

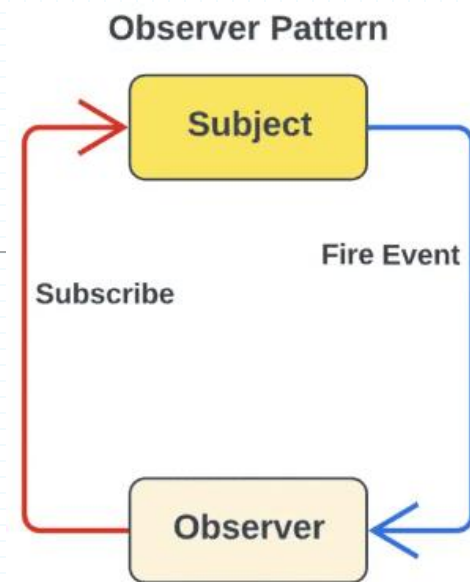

First, create the WeatherData object.

Create the three displays and pass them the WeatherData object.

Simulate new weather measurements.

So.. Observer Pattern

- Define a one-to-many dependency between objects so that when one object changes state, all its dependents are notified and updated automatically.

Other Examples of observer design patterns

- Social Media Platforms for example, many users can follow a particular person(subject) on a social media platform. All the followers will be updated if the subject updates his/her profile. The users can follow and unfollow the subject anytime they want.
- Newsletters or magazine subscription
- Journalists providing news to the media
- E-commerce websites notify customers of the availability of specific products
- More?
